

Mentavio — an educational market simulation. Looking for 10 early testers

I have built an early public alpha of Mentavio, an educational game designed to help beginners understand financial markets and practise decision-making without risking real money.

Mentavio uses fictional companies, simulated funds and fictional market events. It is not a broker, an investment service or a real-money trading platform.

The current version includes:

- a working browser version;
- an Android APK distributed through GitHub Releases;
- a simulated portfolio and fictional market events;
- a live backend connection;
- an educational AI mentor called Sophia, currently being integrated.

I built the project largely by myself with the assistance of AI development tools. The Android application connects to a backend currently running through a secure public tunnel, so this is a limited public alpha rather than a production release.

I am looking for approximately 10 people who can spend 10–15 minutes testing it.

Browser version: <https://shaped-cookie-dangerous-wal.trycloudflare.com/landing/>

<https://github.com/rentar4-cpu/trading-academy/releases/latest/download/Mentavio-android-debug.apk>

The Android application is currently a debug build installed outside Google Play. Android may therefore display a warning before installation.

I would particularly like to know:

1. Did the website or application open successfully?
2. Was it clear what Mentavio is?
3. Was it clear what to do first?
4. Did you encounter an error, broken button or confusing screen?
5. Would this approach help a beginner learn financial-market concepts?
6. What should I improve first?

This is an early alpha. Bugs and incomplete functionality are expected, and honest criticism is much more valuable than compliments.

Please do not enter real financial information, payment-card details or sensitive personal data.
